CROCO – training 2024

TP tests cases

Camille Mazoyer, IRD, camille.mazoyer@ird.fr

Documentation

CROCO
Coastal and Regional Ocean COmmunity model

TUTORIALS

1. System requirements
2. Download
3. Contents & Architecture
4. Summary of essential steps
5. Test Cases
   - 5.1. BASIN
   - 5.2. Set up you own test case
6. Regional: Preparing your configuration
7. Regional: Preprocessing (Matlab)

5. Test Cases

- 5.1. BASIN
- 5.2. Set up you own test case

Previous

Create config directory for basin testcase

ssh -X userX@192.168.1.5

mkdir TRAINING
cd TRAINING
cp -r /home/COMMONDATA/codes/CROCO .
cp CROCO/croco/create_config.bash .
mkdir CONFIGS
vim create_config.bash
./create_config.bash

```
# BEGIN USER MODIFICATIONS

# Machine you are working on
# Known machines: Linux DATARMOR IRENE JEANZAY
# ----------------------------------------------
MACHINE="DATARMOR"

# croco source directory
# ----------------------
CROCO_DIR=

# croco_tools directory
# ---------------------

cppdef.h
Choices of configurations CPPkeys
param.h
Values of variables for your configuration
jobcomp
Compilation
Compile/
Directory for compiling croco (*.F, *.h, …)
Your *.F, *.h
Files you modified
croco.in
Parameters you can modify without re-compiling
*his.nc, *avg.nc
Output netcdf files

Basin test case

Cd TRAINING/CONFIGS/BASIN/CROCO_IN

3. Edit `cppdefs.h` for using BASIN case

```
# define BASIN

# undef REGIONAL
```

You can also explore the CPP options selected for BASIN case.

You can check the BASIN settings in `param.h`.

This is a rectangular, flat-bottomed basin with double-gyre wind forcing. It produces a western boundary current flowing into a central Gulf Stream which goes unstable and generates eddies if resolution is increased.

Compilation

Cd TRAINING/CONFIGS/BASIN

Jobcom should work automatically in Seolane : do not modify it

5. Compile the model:

- By using classical launch command (on individual computers):

```
./jobcomp > jobcomp.log
```

If compilation is successful, you should have a `croco` executable in your directory.

You will also find a `Compile` directory containing the model source files:

- `.F` files: original model source files that have been copied from `$croco/OCEAN`
- `_.f` files: pre-compiled files in which only parts defined by cpp-keys are kept
- `.o` object files

Execution and visualization

6. **Copy the namelist input file for BASIN case:**

   Cp ~/TRAINING/CROCO/croco/TEST_CASES/croco.in.Basin .

   Eventually edit it.

7. **Run the model:**

   ./croco croco.in.Basin

   If your run is successful you should obtain the following files:

```
basin_rst.nc # restart file
basin_his.nc # instantaneous output file
```

8. **Have a look at the results:**

```
ncview basin_his.nc
```

Questions

Cd TRAINING/CONFIGS/BASIN

9. **Test: some questions:**

- What is the size of the grid (see param.h)?
- What are the name of the horizontal directions?
- What is the spatial resolution in both horizontal directions?
- How many vertical levels do you have?
- How are the vertical levels distributed (look for the cpp key `NEW_S_COORD`)?
- What are the initial dynamical conditions (see both cppdefs.h and croco.in)?
- What do the air-sea exchanges look like?

Parallel compilation and execution

CROCO
Coastal and Regional Ocean COmmunity model

Cd TRAINING/CONFIGS/BASIN/CROCO_IN

10. Re-run this case in parallel on 4 CPUs:

To run in parallel, your first need to edit `cppdefs.h`, `param.h`, and to recompile.

- Edit `cppdefs.h`:

```
# define MPI
```

- Edit `param.h`:

```
#ifdef MPI
integer NP_XI, NP_ETA, NNODES
parameter (NP_XI=2,  NP_ETA=2,  NNODES=NP_XI*NP_ETA)
parameter (NPP=1)
parameter (NSUB_X=1, NSUB_E=1)
```

Note

MPI tiles should be at least 20x20 points.

- Recompile.

Parallel compilation and execution

Cd TRAINING/CONFIGS/BASIN/CROCO_IN

- Run the model in parallel:
  - By using classical launch command (on individual computers):

```
mpirun -np NPROCS croco croco.in
```

where NPROCS is the number of CPUs you want to allocate. `mpirun -np NPROCS` is a typical mpi command, but it may be adjusted to your MPI compiler and machine settings.

  - **OR** by using a batch script (*e.g.* PBS) to launch the model (in clusters), examples are provided:

```
cp ~/croco/croco_tools/job_croco_mpi.pbs .
```

Edit `job_croco_mpi.pbs` according to your MPI settings in `param.h` and launch the run:

```
qsub job_croco_mpi.pbs
```

Warning

NPROCS needs to be consistent to what you indicated in `param.h` during compilation
